Professional Summary

Data & Business Intelligence professional with nearly 3 years of enterprise experience delivering end-to-end analytics solutions—from data ingestion and transformation to cloud warehousing and dashboard development. Proficient in Python, SQL, BigQuery, dbt, SAP BW/HANA, Power BI, Tableau, Data Studio, and Streamlit, with a strong focus on scalable data platforms, automation, and business intelligence.

Professional Experience

The University of Texas at Arlington | Graduate Teaching Assistant **Aug 2025 - Present**

- Performed statistical analysis on assessment data using Excel to identify trends, calculate performance metrics, and provide data-driven recommendations to faculty for curriculum improvement.
- Collaborated with faculty to streamline course delivery, maintaining structured grade records and ensuring consistent evaluation standards across assessments.

Infosys | Senior Systems Engineer **Dec 2021 - May 2024**

- Delivered AR and procurement analytics for Levi Strauss & Co. across three global regions (LSE, AMA, LSA) as part of the S/4 Transformation project.
- Designed and optimized SAP BW/HANA data warehouse architecture and ETL pipelines processing large, multi-dimensional enterprise datasets, ensuring data accuracy, consistency, and availability for finance analytics while improving reporting performance.
- Developed high-performance SAP HANA calculation views and star-schema data models supporting automated reporting, dashboard development, and business intelligence for finance stakeholders.
- Managed end-to-end HANA view transport lifecycle across Dev – QA – Pre-Prod environments and resolved post-Go Live incidents during US Hypercare, ensuring zero disruption to production reporting.
- Proactively validated data accuracy in development environments using pre-production datasets prior to deployment, identifying discrepancies in HANA calculation views before they impacted production reporting.
- Investigated root causes for post-Go Live incidents escalated by finance and procurement stakeholders during Hypercare, resolving discrepancies in HANA calculation views and reporting logic to restore accuracy without disrupting production.

Skills

- Data Warehousing & Modeling:** SAP BW/HANA, Google BigQuery, Data Modeling, Star Schema, Fact/Dimension Tables, Medallion Architecture
- Data Pipelines & ETL:** ETL Design, Data Integration and Cleaning, Databricks, dbt, GitHub Actions
- Databases & Querying:** SQL, SAP HANA, BigQuery SQL, Amazon DynamoDB
- Dashboard/Business Intelligence Tools:** Microsoft Power BI, Tableau, Google Looker Studio, Streamlit, Plotly
- Version Control & Workflow:** Git, GitHub, GitHub Actions, CI/CD
- Analytics Methods:** Hypothesis Testing, KPI Analysis, Exploratory Data Analysis
- Programming:** Python, PySpark (Databricks)
- Cloud & Infrastructure:** Google Cloud Platform (GCP), AWS Cloud Technology (S3, EC2, Redshift), Docker
- ERP Systems:** SAP, SAP S/4 HANA, SAP BI/BW

Education

University of Texas at Arlington, TX, USA **Jan 2025 - Dec 2026**

Master of Science, Information Systems *Arlington, TX, USA*

Savitribai Phule Pune University, Maharashtra, India **Aug 2017 - Apr 2021**

Bachelor of Engineering, Mechanical Engineering *Maharashtra, India*

Projects

Formula 1 Analytics Platform | [GitHub](#) Mar 2026

- Built a production-grade end-to-end Formula 1 analytics platform that transforms raw race and telemetry data into an automated, interactive analytics system, enabling near real-time performance analysis across the entire 2026 season. Architected a cloud-native data warehouse by ingesting Practice, Qualifying, Sprint, and Race sessions from the FastF1 API into Google BigQuery, with a dbt transformation layer comprising 5 staging models, 3 mart models, and 34 automated data quality tests to deliver reliable, analytics-ready datasets.
- Engineered a scalable, incremental data pipeline with dynamic F1 calendar discovery, session-level deduplication, and automated GitHub Actions workflows. Delivered Looker Studio dashboards and a Streamlit application enabling self-service analysis through circuit-by-circuit telemetry, championship standings with interactive driver drill-downs.
- Developed a machine learning-based driver fingerprinting framework using Gaussian Mixture Models (GMM) and circuit-normalised performance metrics (lap times expressed as % gap to the circuit fastest), generating probabilistic driver profiles that uncover nuanced performance characteristics beyond traditional lap-time rankings.
- Containerised the platform with Docker and deployed it on Google Cloud and Streamlit Cloud, enabling automated race-weekend data refreshes and a scalable, production-ready cloud analytics solution.
